

DATA GOVERNANCE & RETENTION POLICY

Capstone Project - Sample Policy Document

1. Customer Retention Strategy

Our retention strategy targets a maximum acceptable monthly churn rate of 5%. Any month where churn exceeds this threshold requires a root-cause review by the analytics team within 10 business days. Retention efforts prioritize high-engagement users (top quartile by weekly session count) and focus on proactive outreach rather than reactive discounting.

2. Data Governance Requirements

All structured datasets ingested into the data catalog must include the following metadata fields at minimum: `source_system`, `ingestion_date`, `data_owner`, `retention_period_days`, `pii_classification` (none, low, medium, or high). Datasets missing any of the above fields are considered non-compliant and must be flagged for remediation before being used in downstream reporting or made available to the AI query layer.

3. Schema Cataloging

All datasets must be registered in the central schema catalog (AWS Glue Data Catalog) prior to use. Manual registration is acceptable when automated discovery tools are unavailable, provided the resulting schema is reviewed for accuracy against the source data.
